

DANMAP 2018

DANMAP 2018 - Use of antimicrobial agents and occurrence of antimicrobial resistance in bacteria from food animals, food and humans in Denmark

Criteria for the defining the DADDs for pigs, cattle and mink, DANMAP 2018

DANMAP reports usage of antimicrobials in different animal populations and in veterinary and human sectors. To allow for quantitative comparison in the different populations, the quantity of antimicrobials used, their potency, their formulation, the route of administration, and the age of the animals (where relevant) are accounted for by generating defined animal daily doses (DADDs).

The DADDs are defined for each antimicrobial agent, administration route, pharmaceutical formulation and animal species and when appropriate for each age group. The DADDs have been specifically defined for use in DANMAP and do not always completely match the "prescribed daily dose" or the recommended dosage in the Summaries of Product Characteristics (SPC) at <https://www.ema.europa.eu/en/medicines>.

The DADDs are based on the VetStat ADDs, but re-defined for DANMAP according to following principles:

1. Minor inconsistencies have been corrected e.g. due to rounding of numbers;
2. Approved dosage for the most widely used antimicrobial products is given priority above dosage for products that are rarely used;
3. Approved dosage for older products within the group is maintained as the common DADD even if a new product is approved with a higher dosage;
4. If the dosage for a group with large variation in approved dosages of the products, the dosages provided by "The Veterinary Formulary" [British Veterinary Association 2005, 6th edition] were applied;
5. Dosages may vary within active compound and administration route, if different dosages have been approved for different age group/indication or formulation.

When principle 3 and 4 are conflicting, principle 5 is applied.

The following tables list the DADDs, in mg active compound per kg body weight per treatment day, as applied in DANMAP 2018.

For products containing two or more active compounds, the number of DADDs are estimated for each active compound proportionally to the concentrations in the specific product. For some types of combination products, the ratio between active compounds may vary considerably. In these cases, the main antimicrobial component is given the DADD as in the most widely used similar combination products, and then the DADD for the second component is estimated using the ratio. This approach has been applied for products in ATC_{vet} groups QJ01RA01/ RV01 (benzylpenicillinprocain and dihydrostreptomycin), QJ01FF52 (lincomycin and spectinomycin) and QJ01EW10 (sulfadiazine and trimethoprim).

For each product listed in the VetStat, the dataset provided for DANMAP contains annual sum of active compound prescribed for each animal species by age groups and indication. Based on the total prescribed amount of active compound and the assigned DADDs for each specific product, the annual numbers of kg-doses are calculated as presented in the web annex, Tables A4.1 - A4.3.
