Preface

On behalf of the Danish Veterinary and Food Administration, the DTU Food Institute conducted a study on the nutrient content of mayonnaise-based salad spread products available in Danish supermarkets in May 2021. The analytical data from this project will be included in the Danish Food Composition Database and published in Frida, version 5.4 (www.frida.fooddata.dk).

The project was planned and carried out by Anders Poulsen, Ellen Trolle, Jette Jakobsen, and Marija Langwagen. The sampling plan and sample collection were carried out by Marija Langwagen, while the sample analyses were performed by Eurofins Steins Laboratorium in Vejen, Denmark. The report was prepared in collaboration by Anders Poulsen, Jette Jakobsen, Pauline Sall, and Marija Langwagen.

Summary

This project aimed to generate knowledge about the nutrient content of the most common mayonnaise-based salad spreads on the Danish market.

Based on a market survey, samples were selected to represent the best-selling and most widely available varieties. A total of 11 mayonnaise-based salad spread types were included: chicken salad (including a reduced-fat version), chicken and bacon salad, curry salad, ham salad (including a reduced-fat version), egg salad, horseradish salad, Italian salad, seafood salad, and tuna salad.

In May 2021, 81 samples were collected from supermarkets in the Greater Copenhagen area. Subsamples within each salad spread type were combined in equal amounts to create composite samples. These composites were then analyzed for macro- and micronutrients, including sugars, starch, amino acids, fatty acids, and cholesterol, and a full profile of 13 vitamins (retinol, β-carotene, vitamin D, α-tocopherol, phylloquinone, thiamine, riboflavin, niacin, pantothenic acid, pyridoxine, biotin, folates, cobalamin, and ascorbic acid) and 13 essential minerals (sodium, potassium, calcium, magnesium, phosphorus, iron, copper, zinc, iodine, manganese, chromium, selenium, and molybdenum).

The amino acid analysis included isoleucine, leucine, lysine, methionine, cysteine, phenylalanine, tyrosine, threonine, tryptophan, valine, arginine, histidine, alanine, aspartic acid, glutamic acid, glycine, proline, and serine. The fatty acid profile covered a range of saturated, monounsaturated, and polyunsaturated fatty acids, from C4 to C24, including trans fatty acids.

Dietary fiber was analyzed in four sample types. A few samples were not analyzed for vitamin D and vitamin A (retinol and β-carotene); for these, vitamin content was estimated based on available analytical data from similar sample types.

Protein content was calculated based on the amino acid composition, corrected for water loss due to polymerization. Carbohydrate content was calculated from the measured amounts of sugars, starch, and dietary fiber. Total energy, along with energy contributions from protein, fat, carbohydrates, and dietary fiber, was also reported. Additionally, the percentage of energy derived from saturated fat was included.

All analyses were conducted in duplicate unless otherwise stated and were performed as accredited testing according to ISO 17025 at Eurofins Steins Laboratorium A/S.

The analytical and estimated data from this project will be available in the Danish Food Composition Database and published in Frida, version 5.4 (www.frida.fooddata.dk).

Resumé (Danish)

Projektets formål var at opnå viden om indholdet af næringsstoffer i de mest almindelige pålægssalater på det danske marked.

Baseret på en markedsundersøgelse blev prøverne udvalgt, så de repræsenterede de bedst sælgende og mest udbredte varianter. I alt blev 11 varianter af pålægssalater inkluderet: hønsesalat (inklusive en fedt reduceret variant), kylling og bacon salat, karrysalat, skinkesalat (inklusive en fedt reduceret variant), æggesalat, peberrodssalat, italiensk salat, skaldyrssalat og tunsalat.

I maj 2021 blev 81 prøver indsamlet fra supermarkeder i Storkøbenhavn. Alle tilgængelige delprøver inden for hver pålæggssalattype blev sammenlagt i lige store mængder til i alt 11 pool-prøver.

De 11 pool-prøver blev analyseret for makro- og mikronæringsstoffer, herunder sukkerarter, stivelse, aminosyrer, fedtsyrer og kolesterol, samt 13 vitaminer (retinol, β -caroten, D-vitamin, α -tocopherol, phylloquinon, thiamin, riboflavin, niacin, pantotheninsyre, pyridoxin, biotin, folater, cobalamin og ascorbinsyre) og 13 essentielle mineraler (natrium, kalium, calcium, magnesium, fosfor, jern, kobber, zink, jod, mangan, krom, selen og molybdæn).

Dog blev ikke alle prøver analyseret for kostfibre, kolesterol samt A- og D-vitamin. De analyserede aminosyrer omfattede isoleucin, leucin, lysin, methionin, cystein, phenylalanin, tyrosin, threonin, tryptophan, valin, arginin, histidin, alanin, asparaginsyre, glutaminsyre, glicin, prolin og serin.

Desuden omfattede fedtsyreprofilen en række mættede, monoumættede og polymættede fedtsyrer, der spændte fra C4 til C24, samt transfedtsyrer.

Kostfibre blev analyseret i fire prøvetyper, og enkelte prøver blev ikke analyseret for vitamin D og vitamin A (retinol og β -caroten). For disse blev vitaminindholdet estimeret på baggrund af tilgængelige analyseresultater fra lignende prøvetyper.

Proteinindholdet blev beregnet ud fra indholdet af aminosyrer og korrigert for vandtab som følge af polymerisering. Kulhydratindholdet blev beregnet på baggrund af mængden af kostfibre, sukkerarter og stivelse. Derudover blev det samlede energiindhold samt energibidraget fra protein, fedt, kulhydrater og kostfibre rapporteret. Andelen af energi fra mættet fedt blev ligeledes opgjort.

Alle analyser blev udført som dobbeltbestemmelse med få undtagelser og som akkrediterede analyser i overensstemmelse med ISO 17025 hos Eurofins Steins Laboratorium A/S.

De analytiske og estimerede data fra dette projekt vil være tilgængelige i den danske Fødevaredatabase og offentliggjort i Frida, version 5.4 (www.frida.fooddata.dk).

1. Introduction

Mayonnaise-based salad spreads (pålægssalater) are a type of cold, ready-to-eat sandwich topping commonly used on bread in Denmark. They typically consist of chopped ingredients such as meat, fish, or vegetables mixed with a mayonnaise-based dressing. The term *salat* (salad) in this context originates from the Latin word *salata* (meaning "salted"), which historically referred to cold, seasoned dishes rather than raw vegetables (Den Danske Ordbog).

Rye bread (rugbrød) is a traditional and widely consumed type of bread in Denmark, often enjoyed as an open-faced sandwich (smørrebrød). According to a 2024 study by the Danish Agriculture & Food Council, 37% of surveyed Danes reported having rye bread for lunch the previous day. It is especially popular among people over the age of 60, with over 50% reporting consumption of rye bread for lunch (Landbrug & Fødevarer, 2024). A separate study found that 10% of Danes who ate rye bread for lunch topped it with mayonnaise-based salad spreads, making it the seventh most common lunch choice in Denmark (Coop Analyse, 2021).

The current version of the Danish Food Composition Database (Frida v. 5.3) includes data of three types of mayonnaise-based salad spreads: curry salad, Italian salad, and mackerel salad. However, the available data on nutrient content is limited and does not represent the full range of varieties available on the Danish market.

This study aimed to examine the nutrient composition of 11 types of mayonnaise-based salad spreads available on the Danish market, selected through a market survey. The types included chicken salad (including a reduced-fat version), chicken and bacon salad, curry salad, ham salad (including a reduced-fat version), egg salad, horseradish salad, Italian salad, seafood salad, and tuna salad.

This report documents the sample material, analytical methods, and results for the nutrient content of 81 samples collected from supermarkets in the Greater Copenhagen area during May 2021, considered representative of the Danish market.

The samples were analyzed for macro- and micronutrient content as composite samples, with duplicate determinations and accredited testing in accordance with ISO 17025.

The analytical data from this project will be included in the Danish Food Composition Database and published in Frida, version 5.4 (www.frida.fooddata.dk).

2. Sample Materials

2.1 Market Analysis and Sampling Plan

To ensure a representative selection of the best-selling and most widely available products on the Danish market, product samples were primarily selected based on market volume data. However, since mayonnaise-based salad spreads are a uniquely Danish product and not widely recognized

internationally, no specific market data were available from Euromonitor International. Instead, the selection of salad spread variants was based on information provided by manufacturers and product surveys, which offered insight into the availability and variety of mayonnaise-based salad spreads on the Danish market. This information formed the basis of the sampling plan, with the aim of ensuring the inclusion of the most popular and widely available product variants.

The product survey was conducted through both online store listings and physical visits to supermarkets. Data on all mayonnaise-based salad spread products available in stores were collected from supermarkets across the Capital Region of Denmark between April and May 2021. The survey covered all major grocery retail chains in Zealand with a market share exceeding 5% in 2020, including Salling Group, Coop, Rema 1000, and Dagrofa.

In 2021, approximately 20 different variants of mayonnaise-based salad spreads were available on the Danish market. Many of these (around 40%) contained seafood, including shellfish and fish.

The two leading manufacturers, Stryhns and Danish Crown, collectively offered all 20 variants of salad spreads across various brands. Stryhns produced a full range of well-known salad spread variants under brands such as Graasten, K-Salat, and Sønderjyske Fristelser, which are widely available in multiple supermarket chains, while the brand Mayo was sold exclusively in Rema 1000. In contrast, Tulip products (Danish Crown) were not available in stores owned by Salling or Rema 1000. Bornholmer Slagteren, which only produces ham salad, was available only in Rema 1000 and Netto. In addition, several private label brands also offered mayonnaise-based salad spreads, with each of the four major retail chains supplying between one and four different private label variants.

To identify the most popular salad spread types, the two main manufacturers, Stryhns and Danish Crown, were contacted. Stryhns provided a ranked list of the five most popular Graasten and K-Salat variants based on market reach, while Danish Crown shared an overview of their 11 Tulip variants at that time. Further insights were obtained from online supermarket listings (Coop and Rema 1000) and in-store observations, helping to identify the most relevant variants based on consumer availability and visibility. This combined information formed the basis for the selection of the 11 mayonnaise-based salad spread types included in the study (see Table 1).

Table 1. Mayonnaise-based salad spreads included in the study with names in English and Danish.

Salad Spread Type	Pålægssalatvariant
Chicken Salad	Hønsesalat
Chicken Salad, Less Fat	Hønsesalat, fedt reduceret
Chicken-Bacon Salad	Kylling & bacon salat
Curry Salad	Karrysalat
Egg Salad	Æggesalat
Ham Salad	Skinkesalat
Ham Salad, Less Fat	Skinkesalat, fedt reduceret
Horseradish Salad	Peberrodssalat
Italian Salad	Italiensksalat
Seefood Salad	Skalddyrrssalat
Tuna Salad	Tunsalat

We chose to combine three different seafood-based spreads, Shellfish Salad (Skaldyrssalat), Skagen Salad, and Crab Salad (Krabbesalat)—into a single composite sample named Seafood Salad. These products typically contain ingredients such as surimi (imitation crab meat made from white fish), crab meat, shrimp, and Caviart (a vegetarian alternative to caviar made from seaweed).

Additionally, two reduced-fat salad spread variants (labeled “30% less fat” on the packaging) were included: one from the most popular variant, Chicken Salad, and one from the only meat-based variant, Ham Salad. These reduced-fat versions were included to reflect growing consumer interest in lower-fat options and to ensure that the data represent a broader spectrum of products currently available on the Danish market.

2.2 Collection of Samples

All 81 samples were purchased from supermarkets in the Greater Copenhagen area during May 2021. Each of the 11 composite samples consisted of all products available on the market at the time of sampling, ranging from 4 to 14 different products, except for the reduced-fat variants, which each consisted of only one product. The total volume of each composite sample was at least 2000 g, ensuring sufficient material for the analyses.

Each sample was documented both individually and as part of the composite sample, including information on the weight each contributed to the composite sample. All sampling details, such as date and store, were recorded, along with product information as shown in Appendix A. Additionally, packaging details such as nutrition or health claims, weight, and so forth were also registered and will be available in Frida, version 5.4 (www.frida.fooddata.dk).

Figure 1. Examples of two samples, Curry Salad (2102-POOL-10) and Italian Salad (2102-POOL-06), including information on the weight each product contributed to the composite sample.

Table 2 provides an overview of the subsamples included in the composite samples, including manufacturer, brand name, product name, and the weight contribution of each subsample.

Table 2. Subsamples included in the composite samples and their respective weight contributions.

2.3 Sample preparation.

After collecting the samples, they were stored at a temperature at approximately 4°C. The subsamples for each composite sample were packed in plastic bags at the DTU National Food Institute, while remaining in their original packaging. Each package included information on the weight of the subsamples used in the composite sample.

The samples were then transported to Eurofins Steins Laboratorium A/S in Vejen, Denmark. Within 72 hours, the sample material was homogenized by blending for 15 seconds at maximum speed using a Robot Coupe blender. The homogenized material was then portioned into 100 ml plastic containers and stored at a maximum temperature of maximum –18°C until analysis.

3. Analytical Methods

The analytical program covered a comprehensive range of macronutrients, including nitrogen, amino acids, fat, fatty acids, sugars, starch, dietary fibre, ash, and dry matter, as well as 13 vitamins and 13 selected minerals. The vitamins analyzed were retinol, β-carotene, vitamin D, α-tocopherol, phylloquinone, thiamine, riboflavin, niacin, pantothenic acid, pyridoxine, biotin, folates, cobalamin, and ascorbic acid. The essential minerals included sodium, potassium, calcium, magnesium, phosphorus, iron, copper, zinc, iodine, manganese, chromium, selenium, and molybdenum.

All 11 samples were analyzed for the full set of parameters, apart from dietary fibre (analyzed in four samples), cholesterol (nine samples), retinol (ten samples), β -carotene (eight samples), and vitamin D (ten samples).

A brief overview of the used analytical methods is provided in Appendix B. The 11 samples were analyzed as composite samples, with each analysis planned to be performed in duplicate to ensure accuracy. The analyses were conducted as accredited tests in accordance with ISO 17025:2017 at Eurofins Steins Laboratorium A/S (DANAK TEST Reg. No. 222).

4. Results

The analytical results and estimated values are presented in Appendices C–H:

- Appendix C includes data on macronutrients, dietary fiber, sugars, and starch.
- Appendix D presents the content of vitamins, vitamers, and provitamins.
- Appendix E details the mineral composition.
- Appendix F provides information on amino acid profiles.
- Appendix G contains the analysis of fatty acid composition and cholesterol.
- Appendix H presents the calculated content of carbohydrate and protein.

Estimated nutrient contents for the unanalyzed sample types were derived from the results of the analyzed samples and, where relevant, supplemented with data from the Frida Food Composition Database (DTU, 2024). Additionally, Table 3 presents the total energy content and the proportion of energy derived from saturated fat.

Table 3. Estimated energy content in each of the 11 composite salad spread samples.

Sample Type	Energ ¹ (kJ/100 g)					% Energy from saturated fat ⁴	Sugars ⁵ (g/100g)	Salt ⁶ (g/100g)
	Protein ²	Fat	Dietary fiber	Carbohydrate ³	Total			
Chicken Salad	112	762	4.8	21.9	900	5	0.4	1.7
Chicken Salad, Less Fat	99	481	4.8	28.4	610	5	0	1.8
Italian Salad	30	722	21.6	35.3	810	5	2.2	1.1
Curry Salad	17	747	7.2	76.1	850	5	5.7	0.8
Chicken-bacon Salad	107	995	4.8	31.3	1140	7	0.5	1.8
Horseradish Salad	46	803	25.6	120.6	990	31	12.8	0.3
Seafood Salad	77	1421	4.8	35.4	1540	6	1.6	1.1
Ham Salad	125	992	4.8	28.2	1150	8	1	1.7
Ham Salad, Less Fat	129	685	4.8	34.8	850	11	1.4	1.8
Tuna Salad	145	696	4.8	33.9	880	5	1.6	1.1
Egg Salad	111	833	0	26.7	970	7	0.8	1.3

¹ Energy from protein and carbohydrate contributes 17 kJ/g, fat contributes 37 kJ/g, and dietary fiber contributes 8 kJ/g.

² Protein calculated as nitrogen x 6.25. Nitrogen data from Appendix C.

³ Carbohydrate calculated as available carbohydrate = dry matter – (nitrogen x 6.25) – fat – ash – dietary fiber. All data from Appendix C.

⁴ Saturated fat is the sum of the saturated fatty acids reported in Appendix G.

⁵ Sugars is the sum of sugars reported in Appendix C.

⁶ Salt is calculated as 2.5 times the reported sodium content in Appendix E.

5. Discussion

5.1 Sampling and Representativeness

Sampling was carried out in the Greater Copenhagen area for practical reasons but is considered representative of the Danish market. A broad range of mayonnaise-based salad spreads was included, covering the most popular variants. The selection was based on information from manufacturers, retailer listings, and supermarket surveys, ensuring that the samples reflect the products available to Danish consumers in 2021 at the time of sampling.

All available products within each selected type were collected and pooled in equal amounts to create composite samples. The strength of the project lies in this systematic and representative sampling strategy. A key limitation, however, is that the use of composite samples does not allow for assessment of variation between individual products. Additionally, due to the lack of market share data, samples could not be weighted according to consumer purchasing behavior. Finally, the sampling was limited to supermarket products and does not capture potential variation in the composition of products sold in butcher shops or used in foodservice settings. The extent to which these segments differ nutritionally is currently unknown and represents an area for future research.

Although mackerel salad is a very popular variant of mayonnaise-based salad spread, it was not included in this study, as it is a simple product consisting primarily of mackerel in tomato sauce and mayonnaise. It is anticipated that the nutrient content of this salad will be calculated and published once new data for mayonnaise becomes available.

5.2 Nutrient Content and Energy Contribution

The energy content of the salad spread ranged from 610 kJ/100 g in ‘Chicken Salad, Less Fat’ to 1540 kJ/100 g in ‘Seafood Salad’ (Table 3). The two reduced-fat products, ‘Chicken Salad, Less Fat’ and ‘Ham Salad, Less Fat’, contain 610 kJ/100 g and 850 kJ/100 g, respectively. Both composite samples contain at least 30% less fat than their corresponding full-fat versions, ‘Chicken Salad’ and ‘Ham Salad’, meeting the requirement for the “Less Fat” designation (FVST, 2019).

Most salad spreads contain less than 10% of their energy from saturated fat, which aligns with the use of rapeseed oil as an ingredient in most products and meets the current dietary recommendation (FVST, 2025a). Exceptions include ‘Horseradish Salad’ and ‘Ham Salad, Less Fat’, which provide 31% and 11% of energy from saturated fat, respectively. The high percentage in ‘Horseradish Salad’ appears to be due to the use of hardened coconut oil or palm kernel oil in most subsamples (Appendix A).

5.3 Sodium and Salt Content

Sodium content ranges from 125 mg/100 g in ‘Horseradish Salad’ to 720 mg/100 g in ‘Ham Salad, Less Fat’ (Appendix E). Salt content, calculated as 2.5 times the sodium level, ranges from 0.3 g/100 g to 1.8 g/100 g. Salad spreads containing meat (e.g., chicken, ham) typically have a salt content of 1.7–1.8

g/100 g, comparable to other popular sandwich toppings such as firm cheese and liver pâté (DTU, 2024). Other varieties vary from 0.8 g/100 g in ‘Curry Salad’ to 1.3 g/100 g in ‘Egg Salad’. The recommended maximum salt intake is 5.8 g per day; thus, for example, 50 g of ‘Ham Salad’ would provide approximately 15% of the daily recommendation (FVST, 2025b).

5.4 Sugars

Most products contain one or more sugar types, such as dextrose/glucose, sucrose, or glucose syrup (Appendix A). However, the sugar content is below 2% in all products except for three varieties that do not contain meat or seafood (Appendix C). Horseradish Salad stands out with a sugar content of 13% and is the only product found to contain lactose.

5.5. Missing and Estimated Nutrient Values

Planned duplicate analyses for retinol (8 sample types), β-carotene (7), and vitamin D (5) were not completed as intended. Single determinations were evaluated as acceptable by comparing results with those of other salads and the declared ingredients. Additionally, 14 nutrient values were estimated: dietary fiber (7), cholesterol (2), retinol (1), β-carotene (3), and vitamin D (1), based on the results from other salads, ingredient lists, and information from Frida (DTU, 2024). These estimates are included to ensure a comprehensive dataset generated from this project.

Tunsalat	Xtra	Coop Danmark A/S	Popp Feinkost GmbH, Kaltenkirchen, Germany	5700382686063	Tuna 31% (tuna (Skipjack), salt), water, rapeseed oil, cooked corn 12%, pickled red pepper 9% (pepper, vinegar, sugar, salt), pickled cucumber 5% (cucumber, vinegar, sugar, salt), pasteurized egg yolks (scrambled eggs), vinegar, sugar, salt, thickeners (E412, E415), modified corn starch, acid (E270, E330), chives, dill, acidity regulator (E262), preservatives (E202, E211).	14-06-2021	200	29-05-2021	

Appendix B – Analytical Methods

Nitrogen: NMKL 6:2003. The total amount of organic nitrogen is measured according to the Kjeldahl principle. Test code: DHN10; expanded uncertainty: 5%; LOQ: 0.1 g/100 g.

Amino acids: ISO 13903:2005; EU 152/2009.

- Tryptophane: Alkaline hydrolysis, quantification by HPLC. Test code: DJ009; expanded uncertainty: 10%; LOQ: 0.01 g tryptophan/100 g.
- Methionine and cysteine: Oxidized with hydrogen peroxide and formic acid at low temperature, followed by acid hydrolysis using aqueous hydrochloric acid. Amino acids are separated in an amino acid analyzer and detection using post-column derivatization with ninhydrin reagent at 440 and 570 nm. Test code: DJ011; expanded uncertainty: 15%; LOQ: 0.024 g methionine/100 g og 0.006 g cysteine/100 g.
- All other amino acids such as isoleucine, leucine, lysine, phenylalanine, tyrosine, threonine, valine, arginine, histidine, alanine, aspartic acid, glutamic acid, glycine, proline, serine: Hydrolyzed in aqueous hydrochloric acid and separated by an amino acid analyzer. Spectrophotometric detection is carried out using post-column derivatization with ninhydrin reagent at 440 nm and 570 nm. Test code: DI004; expanded uncertainty: 14%; LOQ: 0.014-0.035 g/100 g.
- Hydroxyprolin not accredited according to ISO17025.

Fat: ISO 11085:2015. The sample is boiled in hydrochloric acid. The washed and dried residue is extracted with petroleum ether. The solvent is evaporated. and the residue is dried and weighed. Test code: DHF77; expanded uncertainty: 6%; LOQ: 0.3 g/100 g.

Fatty acids: AOCS 1f-96 (2009): The fat is liberated from the sample by acid hydrolysis followed by extraction with ether. The triglycerides are esterified to methyl esters with the aid of sodium methylate. C17:0 internal standard. The methyl esters are detected on gaschromatographer with flame ionization detector (GC-FID). Test code: DHF81; expanded uncertainty 10%; LOQ: 0.1 g/100 g for each of the fatty acids.

Dry matter: NMKL 23:1991. The total dry matter content is determined by evaporating all water from the sample by means of heating at a constant temperature. Test code: DHD11; expanded uncertainty: 5%.

Ash: NMKL 173:2005. The sample is treated at 525-550°C, and the ash is weighed. Test code: DHA13; expanded uncertainty: 4%.

Dietary fiber: AOAC 2017.16. Enzymatic treatment. Two precipitations (water-insoluble dietary fibre (IDF), the water-soluble dietary fibre, including the dietary fibre that precipitates in the presence of 78% aqueous ethanol (SDFP) are collected and assayed. The dietary fibre that remains soluble (SDFS) is quantified by HPLC. Test code: HEC1B; expanded uncertainty: 22% for SDFS, 38% for SDFP, 26% for IDF; LOQ: 0.6 for SPFS; 0.4 for SDFP, and 0.4 for IDF.

Sugars (Glucose, fructose, lactose, maltose, sucrose): Single laboratory validated method. The sugars are separated by ion chromatography with NaOH eluant and detected by pulsed amperometry. Notes: Maltodextrin might not be separated from glucose and maltose. Stevia might not be separated from glucose. Maltitol might not be separated from fructose. Test code: AA480; expanded uncertainty: 12% for total sugars; LOQ: 0.2 g/100 g for each individual sugar.

Starch: Prepared according to R-Biopharm kit (No.10207748035). Photometric absorption at 340 nm. Test code: RTT09; expanded uncertainty: 10%; LOQ: 0.5 g/100 g.

Cholesterol: After saponification, the cholesterol is extracted with butyl-methyl-ether and detected and quantified after silylation by GC-FID. Test code: RTU45; Expanded uncertainty: 15%; LOQ: 1 mg/100 g.

Cholesterol: A heat attack with thermo-stable α -amylase and subsequent saponification with ethanolic KOH is performed on the sample; under these conditions the esterified cholesterol is hydrolyzed. The cholesterol is then extracted with isoctane, derivatized and determined by gas chromatography with flame ionization detector (GC-FID). Test code: ID438; expanded uncertainty: approx. 22%.

Retinol (Vitamin A): EN 12823-1:2000. Alkaline hydrolysis using ethanolic potassium hydroxide solution. Extracted three times with hexane:ethylacetate (85:15 v/v). Separated and quantified by normal-phase-HPLC-UV (325 nm). External standard. Test code: A7272; expanded uncertainty: 20%; LOQ: 21 $\mu\text{g}/100 \text{ g}$.

β -carotene (provitamin A): EN 12823-2:2000. All-trans- β -carotene is extracted and separated by RP-HPLC, and quantified by UV/DAD detection (450 nm). External standard. Test code: A7271; expanded uncertainty: ca. 25%; LOQ: 5 $\mu\text{g}/100 \text{ g}$.

Vitamin D (Vitamin D₃, 25-hydroxy vitamin D₃, vitamin D₂, 25-hydroxy vitamin D₂): Alkaline hydrolysis, liquid-liquid extraction, clean-up by solid-phase-extraction. ¹³C-labelled internal standard. Reversed phased-LC-ESI-MS/MS. Reference: Ložnjak Švarc P, Barnkob LL, Jakobsen J (2021): Quantification of vitamin D₃ and 25-hydroxyvitamin D₃ in food – The impact of eluent additives and labelled internal standards on matrix effects in LC-MS/MS analysis. Food Chemistry, 357, pp. 129588. Test code: DH92A; expanded uncertainty: 5% for Vit D₃, 8% for 25-hydroxy vitamin D₃, 12% for vitamin D₂, and 18% for 25-hydroxy vitamin D₂; LOQ: 0.05 $\mu\text{g}/100 \text{ g}$ for each vitamer.

α -tocopherol (Vitamin E): EN 12822:2014. Alkaline hydrolysis, NP-HPLC with fluorescence detection (Ex/Em 290 nm/327 nm). External standard. Test code: A7296; expanded uncertainty: 16%; LOQ: 0.08 mg/100 g.

Phylloquinone (Vitamin K₁): EN 14148:2003. Vitamin K₁ is enzymatically treated to remove fat and extracted by n-hexane. The determination is carried out using RP-HPLC with post-column reduction and fluorimetric detection (Ex.: 243 nm, Em.: 430 nm). Test code: A7293; expanded uncertainty: 20%; LOQ: 0.8 $\mu\text{g}/100 \text{ g}$.

Thiamine (Vitamin B₁): EN 14122:2014. Acid hydrolysis, separation by RP-HPLC, and quantification by fluorescence detection (Ex/Em: 368 nm/440 nm) after post-column oxidation to thiochrome, including hydroxyl-2-ethylthiamine. External standard. Molecular weight reported: 265.36 g/mol. Test code: DJB1E; expanded uncertainty: 16%; LOQ: 0.015 mg/100 g.

Riboflavin (Vitamin B₂): EN 14152:2003. Acid hydrolysis, enzymatic treatment, separation by RP-HPLC, and quantification by fluorescence detection (Ex/Em: 468 nm/520 nm). External standard. Adapted to quantify riboflavin-5-phosphate and riboflavin separately. Test code: DJB33; expanded uncertainty: 16%; LOQ: 0.01 mg/100 g.

Pyridoxine (Vitamin B₆): EN 14164. Acid extraction, followed by treatment with phosphatase. In the presence of Fe(II) as a catalyst, pyridoxamine (PM) reacts with glyoxylic acid and is transformed into pyridoxal (PL), which is then reduced to pyridoxine (PN) by the action of sodium borohydride in an alkaline medium. Pyridoxine is quantified by RP-HPLC with fluorescence detection (Ex/Em: 290 nm/395 nm). External standard. The sum of PM, PL, PN, and phosphorylated PM, PL, PN is quantified, excluding glycosidic-bound pyridoxine. Molecular weight reported: 169.18 g/mol. Test code: A7251; expanded uncertainty: 14%. LOQ: 0.01 mg/100 g.

Niacin (Vitamin B₃): EN 15652:2009. Nicotinic acid and nicotinamide are extracted from samples in a weak hydrochloric acid solution at 100°C, separated by RP-HPLC, and quantified by fluorescence detection (Ex/Em: 322 nm/380 nm) after a post-column reaction with hydrogen peroxide catalyzed by Cu(II) ions under UV radiation (365 nm). External standard. Niacin is calculated as the sum of nicotinic acid and nicotinamide. Molecular weight reported: 123.11 g/mol. Test code: DJB05; expanded uncertainty: 14%; LOQ: 0.1 mg/100 g.

Biotin (Vitamin B₈): LST AB 266.1, 1995. Biotin is extracted from the sample in an autoclave using acid hydrolysis. After dilution with basal medium containing all required growth nutrients except biotin, the growth response of *Lactobacillus plantarum* (ATCC 8014) to extracted biotin is measured turbidimetrically and compared to calibration solutions with known concentrations. Test code: A7284. Expanded uncertainty: 24%; LOQ: 1 µg/100 g.

Pantothenic acid (Vitamin B₅): AOAC 2012.16. LC/MS/MS with isotope dilution. Test code: DJ5BG; expanded uncertainty: 20%; LOQ: 0.007 mg/100 g.

Folate (vitamin B₉): NMKL 111:1985. Folate is extracted from the sample in an autoclave using a buffer solution, followed by enzymatic digestion with human plasma and pancreas V. After dilution with basal medium containing all required growth nutrients except folic acid, the growth response of *Lactobacillus rhamnosus* (ATCC 7469) to extracted folate is measured turbidimetrically and compared to calibration solutions with known concentrations. Test code: A7286; expanded uncertainty: 30%; LOQ: 5 µg/100 g.

Cobalamin (vitamin B₁₂): AOAC 952.20. The sample is treated by a buffer solution in an autoclave. After dilution with basal medium containing all required growth nutrients except cobalamins the growth response of *Lactobacillus leichmanii* (ATCC 7830) to extracted cobalamins is measured turbidimetrically and is compared to calibration solutions. Test code: A7289; expanded uncertainty: 30%; LOQ: 0.01 µg/100 g.

Vitamin C (sum of ascorbic acid and dehydroascorbic acid): The sample is extracted in an aqueous solution containing trichloroacetic acid and the antioxidant tris(2-carboxyethyl)phosphine (TCEP). TCEP reduces dehydroascorbic acid to ascorbic acid. The final extract is analyzed by HPLC with UV detection at 265 nm. The Iso-ascorbic acid will be seen as a peak after the ascorbic acid peak. Reference: Food Chemistry, 94 (2006) 626-631. Test code: A7291; expanded uncertainty: 10%; LOQ: 0.5 mg/100 g.

Sodium, potassium, calcium, magnesium, phosphorus, iron, copper, zinc: EN 13805:2014/EN ISO 11885. Pressure digestion. Analysis of liquid samples by inductively coupled plasma optical emission spectroscopy (ICP-OES).

- Sodium: Test code: SLOAC; expanded uncertainty: 25%.
- Potassium: Test code: SLO3B; expanded uncertainty: 25%.
- Calcium: Test code: SL03C; expanded uncertainty: 25%.
- Magnesium: Test code: SLO2Y; expanded uncertainty: 20%.
- Phosphorus: Test code: SL03A; expanded uncertainty: 25%.
- Iron: Test code: SL03F; expanded uncertainty: 25%; LOQ: 0.5 mg/100 g.
- Copper: Test code: SL03H; expanded uncertainty: 25%.
- Zinc: Test code: SL03I; expanded uncertainty: 20%.

Selenium, chromium, manganese: EN 13805:2014/EN ISO 17294:2016. Pressure digestion. Analysis of liquid samples by inductively coupled plasma mass spectroscopy (ICP-MS).

- Selenium: Test code: SL03Q; expanded uncertainty: 25%; LOQ: 1 µg/100 g.
- Chromium: Test code: SL03D; LOQ: 5 µg/100 g.
- Manganese: Test code: SL03E; expanded uncertainty 25%.
- *Molybdenum*: EN 13805:2014/EN 15763:2010. Pressure digestion. Analysis of liquid samples by inductively coupled plasma mass spectrometry (ICP-MS). Test code: SL03L; 5 µg/100 g.

Iodine: DS EN ISO 15111:2007. Following a thermal extraction with tetramethylammonium hydroxide, detected and quantified by ICP-MS. Test code: DJA19; expanded uncertainty: 20%; LOQ: 5 µg/100 g.

Appendix C – Macronutrients including Sugars, Starch, and Dietary Fiber

¹Total sugars and dietary fiber: content <LOQ, estimated as 0.

²Estimated values are shown in italics.

- Content in Chicken Salad is used as the estimate for the content in Chicken Salad, Less Fat; *Chicken-bacon Salad; Seafood Salad; Ham Salad; Ham Salad, Less Fat; Tuna Salad*.

- The estimate of the total dietary fiber content in *Curry Salad* is based on the content in the ingredient cooked pasta (45%), which has a total dietary fiber content of 2%.

n.e.: Not estimated.

¹Also analysed for vitamin D₂ and 25-hydroxyvitamin D₂: <0.05 µg/100 g.

²Single determination.

³Analysed in triplicate.

⁴Estimated values are shown in italics

- Estimates for vitamin D₃ and 25-hydroxyvitamin D₃ in Seafood Salad <LOQ, as no vitamin D is present in, e.g., shrimps.
- Estimates for retinol in Tuna Salad <LOQ due to the limited amount of retinol in tuna compared to seafood. Estimates for β -carotene are based on the ingredient pickled red pepper (8%), corresponding to 66% of the content in fresh red pepper (Frida; ID 38).
- β -carotene in Egg Salad is estimated from the relative content compared to retinol in egg yolk (ID 1230), i.e., 124/595.
- Estimates for total vitamin D: vitamin D₃ + 2.5 × 25OHD₃.
- Estimates for total vitamin A: If retinol is <LOQ and the content of β -carotene is <126 µg, then LOQ is 21, i.e., similar to retinol. β -carotene contributes by a factor of 1/6 to RE.

In addition to the fatty acids (FA) listed in the table, the following fatty acids were also tested but found to be below the quantification limit of 0.1 g/100 g: C4:0, C6:0, C13:0, C15:0, C17:0, C21:0, C23:0, C24:0, C12:1, n-1; C14:1, n-5; C15:1, n-5; C17:1, n-7; C18:1, n-12; C20:1, n-11; C22:1, n-11; C24:1, n-9; C18:3, n-6; C18:4, n-3; C20:2, n-6; C20:3, n-6; C20:3, n-3; C20:4, n-6; C20:5, n-3; C22:2, n-6; C22:3, n-3; C22:4, n-6; C22:5, n-6; C22:5, n-3; C22:6, n-3; C14:1, trans; C16:1, trans; C18:1, trans 1; C18:1, trans 2; C18:1, trans 3; C20:1, trans; C22:1, trans; C18:2, trans 1; C18:2, trans 2; C18:3, trans 1; C18:3, trans 2; C18:2, trans 4; C24:1, n-9.

¹Single determination.

²Estimates in italics

- for 'Horseradish Salad', estimated as the average of 'Curry Salad' and 'Italian Salad'.
- for 'Tuna Salad', estimated from 32 g tuna/100 g with a cholesterol content of 47 mg/100 g (Frida, ID 904) and 2 g egg yolk/100 g with a cholesterol content of 1076 mg/100 g (Frida, ID 1230).

Appendix H – Calculated Carbohydrate and Protein Content

Sample Type	Sample Number	Carbohydrate ² (g/100 g)	Protein ³ (g/100 g)
Chicken Salad	2101-POOL-02	2.1	5.1
Chicken Salad, Less Fat ¹	2101-POOL-01	2.6	4.5
Italian Salad	2101-POOL-06	5.8	1.3
Curry Salad ¹	2101-POOL-10	8.9	0.83
Chicken-bacon Salad ¹	2101-POOL-08	1.1	5.0
Horseradish Salad	2101-POOL-09	18.1	2.0
Seafood Salad ¹	2101-POOL-11	3.5	3.7
Ham Salad ¹	2101-POOL-04	3.0	6.0
Ham Salad, Less Fat ¹	2101-POOL-03	3.4	6.2
Tuna Salad ¹	2101-POOL-05	3.5	6.9
Egg Salad	2101-POOL-07	1.8	5.7

¹ Dietary fiber estimated content.

² The carbohydrate content was estimated as the sum of sugars, starch, and dietary fibre (Formula 1), where values < LOQ were included as 0 in the calculations.

Formula 1: carbohydrate = fructose + glucose + lactose + maltose + sucrose + starch + dietary fibre (analysed and estimated, see Appendix C)

³ The protein content was estimated using the amino acid method (Formula 2), accounting for the release of one water molecule per amino acid linkage, except for the terminal amino acids.

Formula 2: $\text{Protein} = \sum \frac{\text{mass (amino acids)}}{M_w(\text{amino acids})} * (M_w(\text{amino acids}) - M_w(H_2O))$

Molecular weight (g/mol) used:

Isoleucine	Leucine	Lysine	Methionine	Cysteine	Phenylalanine	Tyrosine	Threonine	Tryptophan
