Preface

On behalf of the Danish Veterinary, Food, Agriculture and Fisheries Agency, the DTU Food Institute conducted a study on the nutrient content of salad dressing, pesto, mayonnaise, and remoulade available in Danish supermarkets. The study was carried out in two periods. Salad dressings, burger dressing, pesto, and aioli were collected during August and September 2021, while mayonnaise and remoulade were collected in February 2023.

The analytical data from this project are included in the Danish Food Composition Database and published in Frida, version 5.5 (www.frida.fooddata.dk).

The 2021 project was planned by Marija Langwagen together with Anders Poulsen and Jette Jakobsen, who also took part in the 2023 project together with Ophelia Pedersen and Sarah Gibbons. Samples were collected by Marija Langwagen in 2021 and by Ophelia Pedersen and Sarah Gibbons in 2023, while the analyses were performed by Eurofins Steins Laboratorium A/S in Vejen, Denmark.

The report was produced through a collaboration between Marija Langwagen, Anders Poulsen, Pauline Sall, and Jette Jakobsen.

Summary

This report presents results from two projects conducted in 2021 and 2023 with the aim of obtaining updated, comprehensive, and in-depth nutrient data for the most common salad dressings, pesto, mayonnaises and remoulades on the Danish market. Existing data for these product categories were limited and partly outdated.

The present study includes a total of 17 composite samples. Seven foods have been provided with updated analytical data, and ten foods were analyzed for the first time.

The samples comprised six salad dressings, three pesto varieties, six mayonnaises, and two remoulades. In addition to the most popular variants, reduced-fat remoulade and mayonnaise and plant-based mayonnaise were included to reflect consumer interest in lower-fat and plant-based options.

Composite samples were prepared from subsamples weighed according to market share or, where such data were unavailable, in equal proportions. All analyses were performed in duplicate under ISO 17025 accreditation at Eurofins Steins Laboratory A/S.

The analytical results showed variation in energy, fat, sugar, and salt content between product types. Pesto samples had the highest energy content, while Italian dressing had the lowest. Saturated fat contributed less than 10% of total energy in all samples. Sugar content was highest in salad dressings and lowest in mayonnaises, and pesto samples had the highest salt content. Micronutrient levels were generally low except in pesto, which showed higher concentrations of selected vitamins and minerals.

The sampling strategy targeted the products most commonly available in major retail chains in the Greater Copenhagen area. Composite sampling provides average nutrient values for each product type but does not capture variation between individual brands. The resulting dataset replaces older entries in the Danish Food Composition Database and reflects products available on the Danish market at the time of sampling.

The analytical and estimated data generated through the projects are incorporated into the Danish Food Composition Database and published in Frida version 5.5 (www.frida.fooddata.dk).

Resumé (Danish)

Denne rapport præsenterer resultaterne fra to projekter gennemført i 2021 og 2023 med det formål at opnå opdaterede, omfattende og dybdegående næringsstofdata for de mest almindelige salatdressinger, pesto, mayonnaiser og remoulader på det danske marked. De eksisterende data for disse produktkategorier var begrænsede og delvist forældede.

Det aktuelle studie omfatter i alt 17 poolprøver. Syv fødevarer er blevet opdateret med nye analytiske data, og ti fødevarer blev analyseret for første gang. Prøverne omfattede seks salatdressinger, tre typer pesto, seks mayonnaiser og to remoulader. Ud over de mest populære produkter blev varianter med reduceret fedt og plantebaserede produkter inkluderet for at afspejle det udvalg, der er tilgængeligt for danske forbrugere. Poolprøverne blev sammensat ud fra delprøver vægtet efter markedsandel eller, hvor sådanne data ikke var tilgængelige, i lige store forhold. Alle analyser blev udført i duplikat under ISO 17025-akkreditering hos Eurofins Steins Laboratorium A/S.

Analyserne viste variation i energi-, fedt-, sukker- og saltindhold mellem produktkategorierne. Pesto havde det højeste energiindhold, mens italiensk dressing havde det laveste. I alle prøver udgjorde mættet fedt mindre end 10 % af den samlede energi. Indholdet af sukker var højest i salatdressinger og lavest i mayonnaiser, mens pesto havde det højeste saltindhold. Mikronæringsstofniveauerne var generelt lave, med undtagelse af pesto, som indeholdt højere koncentrationer af udvalgte vitaminer og mineraler.

Udvælgelsen af produkter var målrettet de mest almindeligt tilgængelige produkter i større dagligvarekæder i Hovedstadsområdet. Poolprøver giver gennemsnitlige næringsstofværdier for hver produkttype, men afspejler ikke variationen mellem individuelle brands. Datasættet erstatter ældre data i Fødevardatabanken og afspejler de produkter, der var tilgængelige på det danske marked på prøveudtagningstidspunktet.

De analytiske og estimerede data fra projekterne er integreret i Fødevardatabanken og offentliggjort i Frida version 5.5 (www.frida.fooddata.dk).

1. Introduction

This report presents results from two projects conducted in 2021 and 2023, aiming to update and expand nutrient data for the most common salad dressings, pesto, mayonnaise, and remoulade available on the Danish market. These condiments vary considerably in composition and use, making it relevant to briefly outline their characteristics.

Salad dressings are typically cold, liquid mixtures of oil, vinegar, and spices, sometimes including dairy products or emulsifiers (Den Danske Ordbog [DDO], 2007). Pesto is traditionally made from basil, Parmesan cheese, pine nuts, and olive oil blended together, although modern commercial products may also include tomatoes, red pepper, or rocket (DDO, 2018). Mayonnaise is a thick, white sauce of oil, vinegar, and egg yolks, usually served cold, while remoulade consists of mayonnaise combined with spices and pickled vegetables. Both mayonnaise and remoulade are commonly used as garnishes on open sandwiches (in Danish: smørrebrød) (DDO, 2003).

Euromonitor International (2024) reports that Danish households consume on average 10 kg of cooking and table sauces per year, corresponding to over 28,000 tonnes in 2024. Ketchup accounts for 41 percent of this total, salad dressings 26 percent, and mayonnaise 14 percent. Pesto and remoulade are categorized separately, with remoulade being the most popular product within the “Other Sauces and Condiments” category, which had total sales of 4,800 tonnes in 2024.

Existing nutrient data for these food categories are incomplete, outdated, and covers only a limited range of products, including ten salad dressings, two mayonnaises, and two remoulades. As a result, they do not adequately reflect the diversity and composition of products currently available on the market.

This report describes the collection and analysis of 17 composite samples purchased from supermarkets in the Greater Copenhagen area during 2021 and 2023. Each composite sample comprised multiple subsamples (4–26 products) with a minimum total weight of 2,000 g, ensuring sufficient material for analysis and coverage of the most widely available products. Samples were analyzed in duplicate for macro- and micronutrients under ISO 17025-accredited laboratory conditions. The resulting data are incorporated into Frida version 5.5 (www.frida.fooddata.dk).

2. Sample Materials

2.1 Market Analysis and Sampling Plan

To ensure a representative selection of the best-selling and most widely available salad dressings, pesto, mayonnaise, and remoulade on the Danish market, samples were selected based on market size data from Euromonitor International (Euromonitor, 2021; 2022), supplemented by product surveys conducted in supermarkets in the Capital Region of Denmark in August 2021 and August 2022. The 2021 survey covered salad dressing, pesto, aioli, and burger dressing, while the 2022 survey

covered remoulade and most of the mayonnaises. Additional information was obtained from manufacturers and distributors of market-leading brands.

This information formed the basis of the sampling plan and resulted in six composite samples of salad dressing, three of pesto, two of mayonnaise in 2021 (aioli and burger dressing), four of mayonnaise in 2023, and two of remoulade. In total, 17 composite samples were included (see Table 1). These samples represented the most popular products on the Danish market. In addition to these, reduced-fat remoulade and mayonnaise and plant-based mayonnaise were included to reflect consumer interest in lower-fat and plant-based options.

Table 1. Overview of condiment types included in the study along with their corresponding ID numbers and the English and Danish product descriptions.

ID Number	Condiment Type	Tilbehørstype (Danish)
	Pesto	Pesto
2103-POOL-07	Basil Pesto	Basilikum pesto
2103-POOL-05	Red Pepper Pesto	Peberfrugt pesto
2103-POOL-08	Tomato Pesto	Tomat pesto
	Salad Dressing	Salatdressing
2103-POOL-02	Crepe Fraiche Dressing	Crepe fraiche dressing
2103-POOL-10	Cæsar Dressing	Cæsar dressing
2103-POOL-03	Garlic Dressing	Hvidløgsdressing
2103-POOL-12	Honey and Mustard Dressing	Honning og sennep dressing
2103-POOL-11	Italian Dressing	Italiensk dressing
2103-POOL-01	Thousand Island Dressing	Thousand Island dressing
	Mayonnaise	Mayonnaise
2103-POOL-04	Burger Dressing	Burger dressing
2301-POOL-03	Chili Mayonnaise	Chili mayonnaise
2301-POOL-01	Classic Mayonnaise	Klassisk mayonnaise
2103-POOL-06	Garlic Mayonnaise (Aioli)	Hvidløgsmayonnaise (Aioli)
2301-POOL-04	Plant-Based Mayonnaise	Plantebaseret mayonnaise
2301-POOL-02	Reduced-Fat Mayonnaise	Fedt reduceret mayonnaise
	Remoulade	Remoulade
2301-POOL-05	Classic Remoulade	Klassisk remoulade
2301-POOL-06	Reduced-Fat Remoulade	Fedt reduceret remoulade

The most widely available brands were identified using Euromonitor brand share data (Euromonitor, 2021; 2022) where available, supplemented by the product surveys described above. The surveys recorded product name, brand, store availability, nutrition declaration, and ingredient list for all products meeting the predefined criteria. Market share data corresponded to the Euromonitor dataset available at the time of sample collection (2020 data for the 2021 survey and 2021 data for the 2022 survey). For condiment types not specified in Euromonitor, such as pesto and salad dressing, product selection was based solely on the survey results. All grocery retailers in Denmark with a

market share above 4%, defined as supermarkets, discounters, hypermarkets, or convenience retailers, were included to ensure comprehensive market representation¹.

2.2 Collection of Samples

The 17 composite samples were collected in two rounds. The first collection, comprising garlic mayonnaise (aioli), burger dressing, salad dressing, and pesto, took place in August and September 2021. The second collection, which included the remaining mayonnaises and remoulade, was conducted in February 2023.

A total of 170 individual product samples were purchased from supermarkets in the Greater Copenhagen area. Each of the 17 composite samples consisted of 4 to 26 individual products (subsamples). The total weight of each composite sample was at least 2,000 g to ensure sufficient material for analyses.

Subsamples were selected using Euromonitor brand share data where available (regular and reduced-fat mayonnaise and remoulade) and supplemented with systematic product surveys. When Euromonitor data were missing or the condiment type was not specified, all available subsamples were included and either weighted according to store availability (e.g., chili and plant-based mayonnaise) or in equal amounts (salad dressing, pesto, aioli, burger dressing). Table 2 and 3 provide information on the number of subsamples included in each of the 17 composite samples, as well as the weight contribution of each brand.

Table 2. Overview of the pesto and salad dressing composite samples, including ID number, condiment type, number of subsamples, and the distribution of subsamples in each composite sample.

ID Number	Condiment Type	Number of Samples	Subsample Distribution in Composite Sample
Pesto			
2103-POOL-07	Basil Pesto	26	Equal weight per subsample
2103-POOL-05	Red Pepper Pesto	8	Equal weight per subsample
2103-POOL-08	Tomato Pesto	25	Equal weight per subsample
Salad Dressing			
2103-POOL-02	Creme Fraiche Dressing	14	Equal weight per subsample
2103-POOL-10	Cæsar Dressing	5	Equal weight per subsample
2103-POOL-03	Garlic Dressing	11	Equal weight per subsample
2103-POOL-12	Honey and Mustard Dressing	4	Equal weight per subsample
2103-POOL-11	Italian Dressing	7	Equal weight per subsample
2103-POOL-01	Thousand Island Dressing	14	Equal weight per subsample

¹ Lidl, with a market share of approximately 3.5% in both 2020 and 2021, was not included in the 2021 collection but was included in 2023 due to a slight increase in market share.

Table 3. Overview of the mayonnaise and remoulade composite samples, including ID number, condiment type, number of subsamples, and the distribution of subsamples in each composite sample.

ID Number	Condiment Type	Number of Samples	Subsample Distribution in Composite Sample
Mayonnaise			
2103-POOL-04	Burger Dressing	7	Equal weight per subsample
2301-POOL-03	Chili Mayonnaise	8	Equal weight per subsample
2301-POOL-01	Classic Mayonnaise	7	Unequal distribution: K-Salat 30%, Graasten 20%, Budget 10%, Coop 10%, Hellmann's 10%, Xtra 10%, Urtekram 10%
2103-POOL-06	Garlic Mayonnaise (Aioli)	13	Equal weight per subsample
2301-POOL-04	Plant-Based Mayonnaise	5	Unequal distribution: Graasten 33%, Bähncke 17%, Hellmann's 17%, Plantekøkkenet 17%, Spir 17%
2301-POOL-02	Reduced-Fat Mayonnaise	6	Unequal distribution: K-Salat 33%, Graasten 25%, Hellmann's 17%, Kraft 17%, Budget 8%
Remoulade			
2301-POOL-05	Classic Remoulade	7	Unequal distribution: Graasten 29%, Bähncke 14%, Coop 14%, First Price 14%, K-Salat 14%, Xtra 14%
2301-POOL-06	Reduced-Fat Remoulade	5	Unequal distribution: Graasten 29%, K-Salat 29%, Budget 14%, Kania 14%, Rema 1000 14%

All samples were visually documented through photographs showing both individual subsamples and the final composite sample. Each composite sample was accompanied by documentation specifying the exact weight in grams of each subsample. Three examples illustrating the variety of subsamples are shown in Figures 1 to 3.

Figure 1

Figure 2

Figure 1. Composite sample of Reduced-Fat Remoulade (2301-POOL-06), with each of the five brands contributing according to brand share (Graasten and K-salat 580 g each, other brands 290 g each). **Figure 2.** Composite sample of Thousand Island Dressing (2103-POOL-01), with each of the 14 brands contributing 150 g.

Figure 3. Composite sample of Tomato Pesto (2103-POOL-08), with each of the 25 brands contributing 80 g.

All sampling details, including date, store, and product information such as ingredients, were recorded (see Appendix A). Packaging details, including nutritional or health claims and net weight, were also registered and will be available in the next version of the Danish Food Composition Database, to be published at www.frida.fooddata.dk. More detailed information on the 17 composite samples is provided in Appendix A.

2.3 Sample preparation.

After collection, the samples were stored either under refrigeration at approximately 4 °C for chilled products or under conditions similar to typical supermarket storage at approximately 18 °C for ambient products. The subsamples for each composite sample were packed in plastic bags at the DTU National Food Institute while remaining in their original packaging. Each package included information on the weight of the subsamples used to prepare the composite sample (see Figures 1-3).

The samples were then transported to Eurofins Steins Laboratorium A/S in Vejen, Denmark. Within 72 hours, each composite sample, consisting of several individual samples, was blended using a Robot Coupe (Vincennes, France) for 15 seconds. Blending was performed in intervals if necessary to avoid heating. The homogenized sample was stored in plastic containers of 100 g at a maximum temperature of minus 18 °C until analysis.

3. Analytical Methods

All samples were analyzed in duplicate for macronutrients and their components, including nitrogen and amino acids, fat and fatty acids, sugars, starch, dry matter, and ash. Samples expected to contain dietary fiber were analyzed for both soluble and insoluble fractions.

All samples were also analyzed for minerals and selected vitamins. Only vitamins expected to be present in measurable quantities were included in the analysis. All analyses were conducted as

accredited tests under ISO 17025:2017 at Eurofins Steins Laboratorium A/S (DANAK TEST Reg. No. 222). A brief overview of the analytical methods is provided in Appendix B.

4. Results

The analytical results are presented in Appendices C–G:

- Appendix C: Macronutrients, including sugars, starch, and dietary fibre
- Appendix D: Vitamins
- Appendix E: Minerals
- Appendix F: Amino acids
- Appendix G: Fatty acids and cholesterol

Estimated values for nutrients not analyzed in all samples are provided in italics. Appendix H provides information on estimations based on ingredients for vitamin D and vitamin B₁₂. **Table 4** presents the total energy content and the proportion of energy derived from saturated fat.

Table 4. Energy and selected macronutrients in composite samples of pesto, salad dressing, mayonnaise, and remoulade.

Condiments	Protein ²	Fat	Energy ¹ (kJ/100 g)		Total	% Energy from saturated fat ⁴
			Dietary fiber	Carbohydrate ³

¹ Energy from protein and carbohydrate contributes 17 kJ/g, fat contributes 37 kJ/g, and dietary fibre contributes 8 kJ/g.

² Protein calculated as nitrogen x 6.25. Nitrogen data from Appendix C.

³ Carbohydrate calculated as available carbohydrate = dry matter – (nitrogen × 6.25) – fat – ash – dietary fibre. All data from Appendix C.

⁴ Saturated fat is the sum of the saturated fatty acids reported in Appendix G.

Figure 4 presents the salt content of all composite samples, calculated from the sodium content (Appendix E), and **Figure 5** present the sugar content of all composite samples, calculated as the sum of mono- and disaccharides (Appendix C).

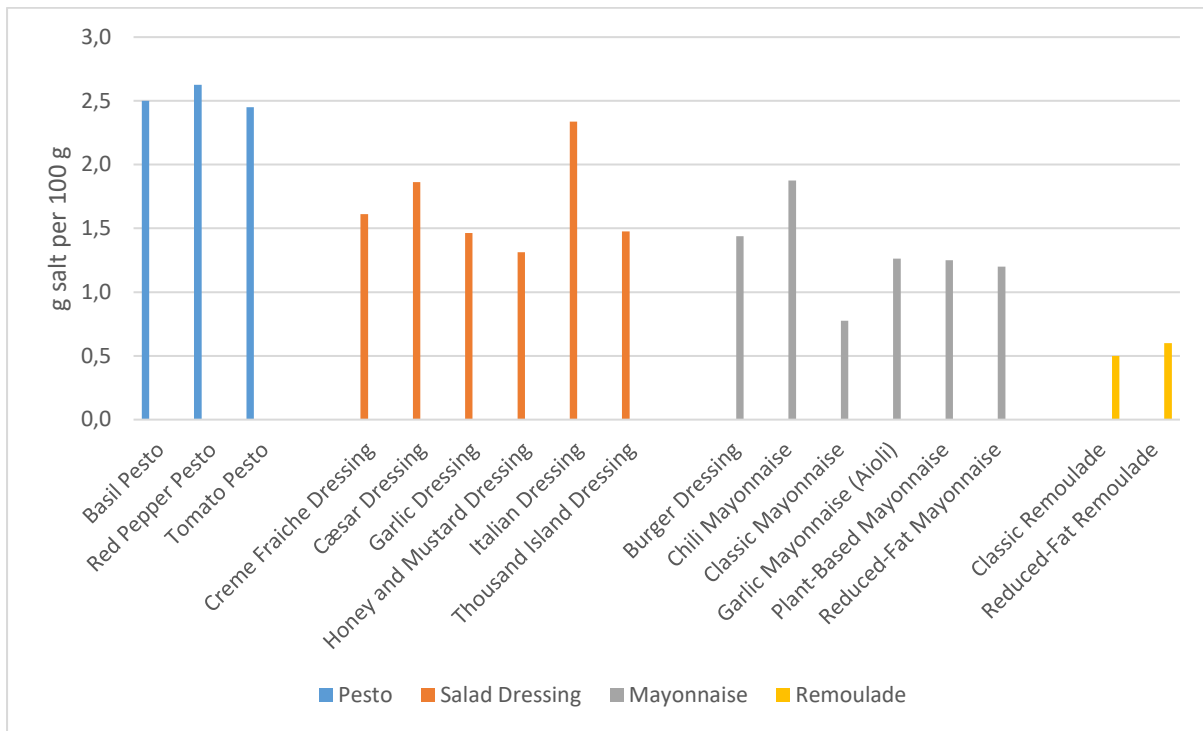

Figure 4. Salt content (g per 100 g) in all composite samples, calculated as 2.5 times the sodium content (Appendix E).

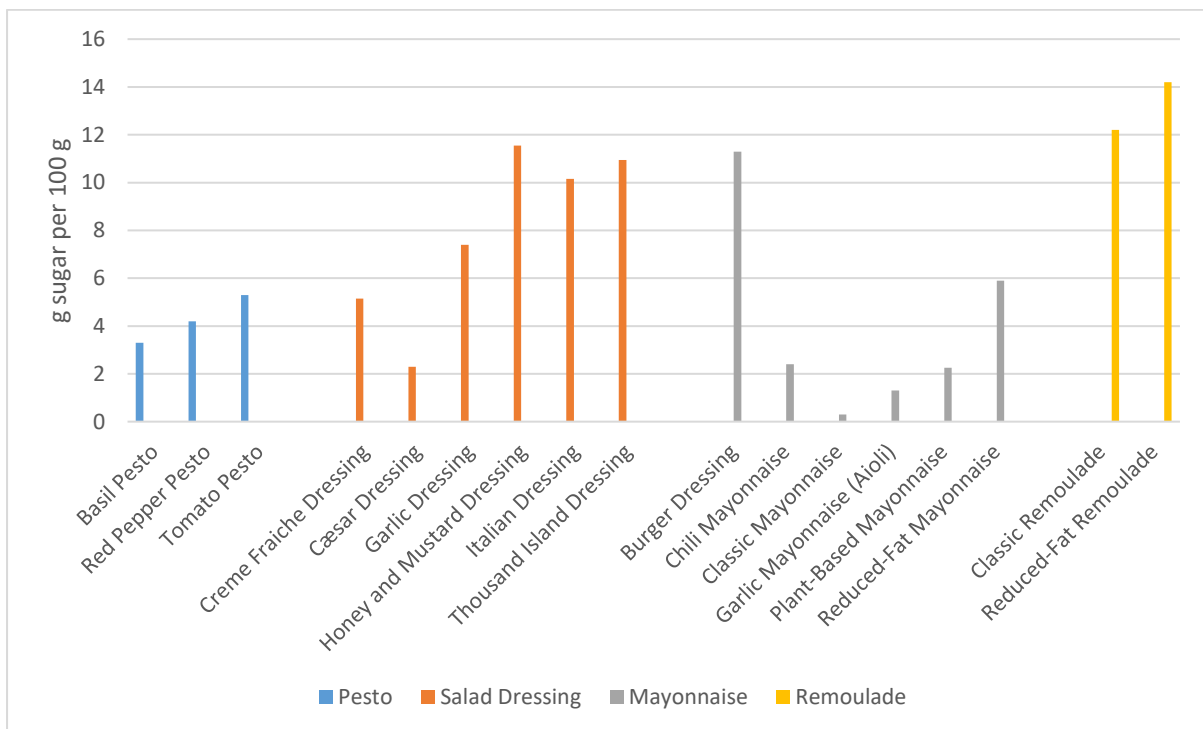

Figure 5. Sugar content (g per 100 g) in all composite samples, calculated as the sum of mono- and disaccharides (Appendix C). Values below the limit of quantification were assigned a value of zero.

5. Discussion

5.1 Sampling and Representativeness

The sampling strategy was designed to capture the most widely available salad dressings, pesto, mayonnaise, and remoulade products on the Danish retail market. By combining Euromonitor market share data with systematic product surveys across major grocery retailers, the study ensures broad coverage of the products most commonly purchased by consumers. The inclusion of full-fat (Classic), reduced-fat, and plant-based variants also reflects current diversification within these product categories and provides a more complete nutritional profile of the products available in 2021-2023.

Sampling was conducted exclusively in the Greater Copenhagen area for logistical reasons. Although this region includes all major supermarket chains and therefore represents a comprehensive share of the national retail market, regional specialty brands or products available primarily in smaller independent stores may not be fully represented. This limitation is considered minor but should be acknowledged when interpreting the generalizability of the results.

Composite samples made up of multiple subsamples based on market share allow for a realistic estimate of the average nutrient composition for each product type within a realistic budget. In this sampling design, the most frequently purchased brands contribute proportionally to the final dataset. For product groups without distinct Euromonitor categorisation, such as pesto and salad dressings, equal weighting based on store availability was used. However, analyses of composite samples do not provide information on potential variability between individual brands.

5.2 Energy Contribution

The analytical results reveal substantial variation in energy and fat content across the included condiments (Table 4). This was expected given their diverse ingredient profiles.

Pesto products exhibit the highest energy density (1323 to 1669 kJ per 100 g), consistent with their high content of vegetable oils, nuts, and cheese. Salad dressings show a broader variation, ranging from the relatively low energy italian dressing (433 kJ per 100 g) to honey/mustard dressing (1752 kJ per 100 g). These differences largely reflect variations in fat content and the presence of added sugars.

Mayonnaises demonstrate the widest range, from reduced-fat mayonnaise (1267 kJ per 100 g) to classic mayonnaise (2941 kJ per 100 g). The classic variant contains more than 79 g fat per 100 g, which corresponds closely to typical traditional mayonnaise formulations. Plant-based mayonnaise displays energy and fat levels similar to full-fat egg-based variants, indicating that plant-based products are not necessarily lower in energy.

The two remoulade products fall within a moderate energy range (940 to 1240 kJ per 100 g), which aligns with their formulation as mayonnaise-based sauces containing added vegetables and seasonings.

Overall, the results show that condiments are generally energy-dense foods with substantial contributions from fat. However, the proportion of energy derived from saturated fat in all samples aligns with the recommendation that saturated fat should not exceed 10% of total energy (Table 4). These findings are comparable to those observed for mayonnaise-based salad spreads (Langwagen, Poulsen, Sall, & Jakobsen, 2025).

For sugars, the content in salad dressings ranged from 2.0 to 8.1 g per 100 g (mean 6.2 g per 100 g), while in mayonnaises it ranged from 0.3 to 9.6 g per 100 g (mean 3.3 g per 100 g). The variation in pesto and remoulade was smaller, with average contents of 2.7 g per 100 g and 12.1 g per 100 g, respectively (Figure 5). As noted above, the composite sampling protocol does not allow identification of differences within a product type, but the results clearly show substantial variation between product types.

Consumers may be unaware that these products contribute to dietary sugar intake. A rough estimation of sugar intake based on Euromonitor per capita sales data suggests that daily consumption of salad dressing at 3.3 g per person and mayonnaise at 1.8 g per person could contribute approximately 0.2 g and 0.1 g sugar per person per day, respectively. These values are indicative and reflect sales volumes rather than true dietary intake.

Although pesto was represented by the highest number of subsamples, its contribution to overall dietary energy and fat intake is limited because consumption quantities are small. The extensive sampling within this category was methodologically advantageous, as it captured the considerable product diversity on the Danish market and ensured robust estimates of average nutrient composition. However, given the relatively narrow variation observed in energy and fat content and the low consumption volumes, future studies could include fewer subsamples without materially affecting the estimated average composition.

5.3 Salt and Micronutrients

Salt content differed substantially between product types. Pesto samples had the highest content at approximately 2.5 g per 100 g, while remoulade products had the lowest at 0.5 g per 100 g (Figure 4). Except for pesto, the salt content in the remaining salad dressings and mayonnaises was at a similar level to that reported for mayonnaise-based salad spreads (Langwagen, Poulsen, Sall, & Jakobsen, 2025).

All salad dressings and most mayonnaises had a salt content above 1 g per 100 g, with the exception of Classic Mayonnaise (0.78 g per 100 g). Across categories, the average salt content was 1.7 g per 100 g for salad dressing and 1.3 g per 100 g for mayonnaise.

Similar to sugar, an estimate of dietary salt intake based on sales volumes from Euromonitor shows that a person would have a daily intake of approximately 0.056 g salt from salad dressing and 0.023 g salt from mayonnaise. Compared to the recommended maximum daily intake of 5.8 g salt (NNR, 2023), these estimates indicate that up to 1.4% of daily salt intake may come from salad dressing and mayonnaise. It should be emphasised that these estimates are based on sales volumes and not actual

consumption data. Salt intake from pesto and remoulade is assumed to be lower because of both lower consumption quantities and, for remoulade, a generally lower salt content.

Vitamin and mineral contents were generally low but comparable to levels reported for mayonnaise-based salad spreads (Langwagen, Poulsen, Sall, & Jakobsen, 2025). Exceptions included pesto, which had higher contents, and honey/mustard dressing and Italian dressing, which had lower contents of micronutrients (Appendix D and Appendix E).

5.6. Strengths, Limitations, and Implications

A major strength of the project is the comprehensive methodological approach combined with the use of accredited analytical methods, which ensures that the resulting nutrient values can be used reliably for dietary surveys, modeling, labelling, and public health monitoring.

Limitations primarily relate to representativeness and data granularity. Composite samples provide realistic average values but obscure variation between individual brands, which may be relevant for specific consumer groups or dietary patterns. For some product categories, limited availability of precise market share data required equal weighting, which may shift the nutritional profile slightly compared with true purchase patterns.

6. Perspectives

The dataset represents a substantial and necessary update to the Danish Food Composition Database, replacing older or incomplete entries and covering product types that were previously underrepresented. The updated data will strengthen the accuracy of dietary assessments in Denmark and support future research into condiment consumption and nutritional contributions.

Sampling was limited to consumer-ready retail products and did not include condiments used in foodservice settings. These products may differ in fat quality, ingredient composition, or salt content and therefore represent an area for potential future data collection.

Together, these results provide a more robust basis for monitoring trends in condiment composition and can inform future updates of the Danish Food Composition Database as market offerings continue to evolve.

Remoulade Light	Rema 1000	5705830003515	59% vand, 15% rapsolie, 12% sukker, 3% modificeret majsstivelse, 3% syltede agurker (agurk, vand, eddike, salt), 2% tørret hvidkål, løgpulver, æggeblommepulver, estragoneddike, sennepspulver, eddike, tørret blomkål, surhedsregulerende midler (E270, E262, E296), salt, konserveringsmidler (E211, E202), gurkemeje, stabilisatorer (E415, E412), karry	59% water, 15% rapeseed oil, 12% sugar, 3% modified corn starch, 3% pickled cucumbers (cucumber, water, vinegar, salt), 2% dried white cabbage, onion powder, egg yolk powder, tarragon vinegar, mustard powder, vinegar, dried cauliflower, acidity regulators (E270, E262, E296), salt, preservatives (E211, E202), turmeric, stabilisers (E415, E412), curry	06-05-2023	06-02-2023
Let Remoulade	Budget	5712871868508	Vand, 17% rapsolie, eddike, sukker, modificeret majsstivelse, 2% tørret hvidkål, æggeblommepulver, sennepsmel, surhedsregulerende midler (E296, E270), salt, løgpulver, konserveringsmidler (E211, E202), stabilisatorer (E415, E412, E410), estragoneddike, karry, gurkemeje, citronkoncentrat, koriander, cayennepeber	Water, 17% rapeseed oil, vinegar, sugar, modified corn starch, 2% dried white cabbage, egg yolk powder, mustard flour, acidity regulators (E296, E270), salt, onion powder, preservatives (E211, E202), stabilisers (E415, E412, E410), tarragon vinegar, curry, turmeric, lemon concentrate, coriander, cayenne pepper	25-03-2023	06-02-2023
Remoulade Light	Kania	4056489245704	Vand, 16% hvidkål, 15% rapsolie, sukker, eddike, 6% blomkål, 4% syltet agurk (agurk, vand, eddike, salt), løg, modificeret majsstivelse, æggeblomme, estragoneddike, surhedsregulerende midler (mælkesyre, natriumacetat, æblesyre), sennepspulver, salt, konserveringsmidler (natriumbenzoat, kaliumsorbitat), karry, gurkemeje, stabilisatorer (xanthangummi, guar gummi)	Water, 16% white cabbage, 15% rapeseed oil, sugar, vinegar, 6% cauliflower, 4% pickled cucumber (cucumber, water, vinegar, salt), onion, modified corn starch, egg yolk, tarragon vinegar, acidity regulators (lactic acid, sodium acetate, malic acid), mustard powder, salt, preservatives (sodium benzoate, potassium sorbate), curry, turmeric, stabilisers (xanthan gum, guar gum)	16-04-2023	06-02-2023

Appendix B – Analytical Methods

Nitrogen: NMKL 6:2003. The total amount of organic nitrogen is measured according to the Kjeldahl principle. Expanded uncertainty: 5%.

Amino acids: ISO 13903:2005; EU 152/2009. Tryptophan: Alkaline hydrolysis, quantification by HPLC. Methionine and cysteine: Oxidized with hydrogen peroxide and formic acid at cold temperature, followed by acid hydrolysis using aqueous hydrochloric acid. Amino acids are separated in an amino acid analyzer and the detection is carried out using post column derivatisation with ninhydrin reagent at 440 and 570 nm. All other amino acids: Hydrolyzed in aqueous hydrochloric acid and separated in an amino acid analyzer. The spectrophotometric detection is carried out using post column derivatisation with ninhydrin reagent at 440 nm and 570 nm. Expanded uncertainty: 14%, but 10% for tryptophan.

Fat: ISO 11085:2015. The sample is boiled in hydrochloric acid. The washed and dried residue is extracted with petroleum ether. The solvent is evaporated, and the residue is dried and weighed. Expanded uncertainty: 6%.

Fatty acids: AOCS 1f-96 (2009). The sample is boiled in hydrochloric acid and the fat is extracted using a mixture of diethyl- and petroleum ether. Treated with sodium hydroxide and boron trifluoride in methanol to form fatty acid methyl esters (FAMES), measured by GC-FID. C17:0 internal standard. Expanded uncertainty: 10%.

Cholesterol: After saponification, the cholesterol is extracted with butyl-methyl-ether followed by silylation for determination by GC-FID. Expanded uncertainty: 15%.

Dry matter: NMKL 23:1991. The total dry matter content is determined by evaporating all water from the sample by means of heating it at a constant temperature. Expanded uncertainty: 5%.

Ash: NMKL 173:2005. The sample is ashed at 525-550°C, and the ash weighed. Expanded uncertainty: 4%.

Retinol (Vitamin A): EN 12823-1:2000. Alkaline hydrolysis using ethanolic potassium hydroxide solution. Extracted with hexane:ethylacetate. Separated and quantified by NP-HPLC-UV (325 nm). External standard. Limit of quantification: 21 µg/100 g.

β-carotene (Vitamin A): Adaption of method based on EN 12823-2:2000. All-trans-β-carotene and 13-cis-β-carotene is extracted and separated by RP-HPLC, and quantified by UV/DAD detection (450 nm). External standard. Limit of quantification: 5 µg/100 g.

Vitamin D (Vitamin D3, 25-hydroxy vitamin D3, vitamin D2, 25-hydroxy vitamin D2): Alkaline hydrolysis, liquid-liquid extraction, clean-up by solid-phase-extraction. RP-LC-ESI-MS/MS. 13C- labelled internal standard. Ložnjak Švarc P, Barnkob LL, Jakobsen J (2021): Quantification of vitamin D₃ and 25-hydroxyvitamin D₃ in food – The impact of eluent additives and labelled internal standards on matrix effects in LC-MS/MS analysis. Food Chemistry, 357, pp. 129588.

α-tocopherol (vitamin E): EN 12822:2014. Alkaline hydrolysis, NP-HPLC with fluorescence detection (Ex/Em 290 nm/327 nm). External standard. Expanded uncertainty: 16%.

Vitamin K (phylloquinone and menaquinone 4 to 10). The internal standards *d7*-phylloquinone, *d7*-menaquinone-4, *d7*-menaquinone-7, and *d7*-menaquinone-9 are added to the samples. Extraction performed by boiling 2-propanol. Following evaporation to dryness, the fat is degraded enzymatically by use of two lipases. The extract is evaporated to dryness, and clean-up by liquid-liquid extraction followed by silica SPE. Evaporation to dryness, dissolved in ethanol followed by separation, detection and quantification of phylloquinone, MK-4 to MK-10 using LC-APCI-MS/MS. Jensen MB, Rød KE, Ložnjak Švarc P, Oveland E, Jakobsen J (2022): Vitamin K (phylloquinone and menaquinones) in foods – Cost-effective quantification by LC-ESI-MS/MS. Food Chemistry 385 (2022) 132672, <https://doi.org/10.1016/j.foodchem.2022.132672> (modified to use APCI for detection and quantification).

Vitamin K (Phylloquinone) if not analyzed for menaquinones: EN 14148:2003. Sample is enzymatically treated to remove fat and vitamin K1 extracted by *n*-hexane. Separated by RP-HPLC with post-column reduction by zinc and fluorescence detection (Ex/Em: 243 nm/430 nm). External standard. Applied to pesto, Salad Dressing, Burger Dressing and Aioli.

Thiamin incl. hydroxyl-2-ethylthiamin: EN 14122-2014. Acid hydrolysis, separation by RP-HPLC and quantified by fluorescence detection (Ex/Em: 368 nm/440 nm) after post-column oxidation to thiochrome. External standard. Expanded uncertainty: 16%.

Riboflavin: EN 14152:2003. Acid hydrolysis, enzymatic treatment, separation by RP-HPLC, quantified by fluorescence detection (Ex/Em: 468 nm/520 nm). External standard. Adapted to quantify riboflavin-5-phosphate and riboflavin separately. Expanded uncertainty: 16%.

Pyridoxine: EN 14164. Acid extraction, followed by treatment with phosphatase. By reaction with glyoxylic acid in the presence of Fe²⁺ as catalyst, pyridoxamine is transformed into pyridoxal, which is then reduced to pyridoxine by the action of sodium borohydride in alkaline medium. Pyridoxine is finally quantified by RP-HPLC with fluorescence detection (Ex/Em: 290 nm/395 nm). External standard. Expanded uncertainty: 14%.

Niacin: EN 15652:2009. Nicotinic acid and nicotinamide are extracted from samples in a weak hydrochloride acid solution at 100 °C, separated by RP-HPLC, detected and quantified by fluorescence detection (Ex/Em: 322 nm/380 nm) after a post column reaction with hydrogen peroxide catalyzed by Cu(II) ions under UV-radiation (365 nm). External standard. Niacin is calculated as the sum of nicotinic acid and nicotinamide. Expanded uncertainty: 14%.

Biotin: LST AB 266.1,1995. Biotin is extracted from the sample in an autoclave using acid hydrolysis. After dilution with basal medium containing all required growth nutrients except biotin the growth response of *Lactobacillus plantarum* (ATCC 8014) to extracted biotin is measured turbidimetrically and is compared to calibration solutions with known concentrations. Expanded uncertainty: 24%.

Pantothenic acid: AOAC 2012.16. LC/MS/MS with isotope dilution. Expanded uncertainty: 20%.

Folates: NMKL 111:1985. Folate is extracted from the sample in an autoclave using a buffer solution, followed by an enzymatic digestion with human plasma and pancreas V. After dilution with basal medium containing all required growth nutrients except folic acid the growth response of *Lactobacillus rhamnosus* (ATCC 7469) to extracted folate is measured turbidimetrically and is compared to calibration solutions with known concentrations. Limit of quantification: 5 µg/100 g.

Cobalamin (vitamin B₁₂) Microbiological quantification using growth in *Lactobacillus Delbrueckii*, and measurement of turbidity.

Vitamin C (ascorbic acid and dehydroascorbic acid): The sample is extracted in an aqueous solution containing trichloroacetic acid and the antioxidant tris(2-carboxyethyl)phosphine (TCEP). TCEP reduces dehydroascorbic acid to ascorbic acid. The final extract is analyzed by HPLC with UV detection at 265 nm.

Sodium, potassium, calcium, magnesium, phosphorous, iron, copper, zinc: EN 13805:2014/EN ISO 11885. Pressure digestion. Analysis of liquid samples by inductively coupled plasma optical emission spectroscopy (ICP-OES).

Selenium, chromium, manganese: EN 13805:2014/EN ISO 17294:2016. Pressure digestion. Analysis of liquid samples by inductively coupled plasma mass spectroscopy ICP-MS.

Molybdenum: EN 13805:2014/EN 15763:2010. ICP-MS/MS Pressure digestion. Analysis of liquid samples by inductively coupled plasma mass spectrometry ICP-MS.

Iodine: DS EN ISO 15111:2007. Determination of iodine by ICP-MS.
